

IATF - International Automotive Task Force

IATF 16949:2016 – Sanctioned Interpretations

IATF 16949 1st Edition was published in October 2016 and was effective 1 January 2017. The following Sanctioned Interpretations were determined and approved by the IATF. Unless otherwise indicated, Sanctioned Interpretations are applicable upon publication.

Revised text is shown in **blue**.

A Sanctioned Interpretation changes the interpretation of a rule or a requirement which itself then becomes the basis for a nonconformity.

SI 1-9 issued in October 2017, effective October 2017

SI 10-11 issued in April 2018, effective June 2018

SI 8 revised and reissued in June 2018, effective July 2018

SI 10 revised and reissued in June 2018, effective July 2018

SI 12-13 issued in June 2018, effective July 2018

SI 14-15 issued in November 2018, effective January 2019

SI 16 - 18 issued in October 2019, effective January 2020
SI 4 revised and reissued in August 2020, effective September 2020
SI 19 issued in August 2020, effective October 2020
SI 20 issued in December 2020, effective January 2021
SI 10 revised and reissued in April 2021, effective June 2021
SI 3 revised and reissued July 2021, effective November 2021
SI 21-22 issued July 2021, effective November 2021
SI 10 revised and reissued in July 2021, effective August 2021
SI 23-25 issued May 2022, effective June 2022
SI 26 issued November 2024, effective November 2024
SI 23 revised and reissued in November 2025, effective November 2025
SI 27-30 issued November 2025, effective November 2025

NUMBER	IATF 16949 REFERENCE	SANCTIONED INTERPRETATION
1	3.1 Terms and definitions for the automotive industry	customer requirements all requirements specified by the customer (e.g., technical, commercial, product and manufacturing process-related requirements, general terms and conditions, customer-specific requirements, etc.) Where the audited organization is a vehicle manufacturer, vehicle manufacturer subsidiary, or joint venture with a vehicle manufacturer, the relevant customer is specified by the vehicle manufacturer, their subsidiaries, or joint ventures. <i>Rationale for change:</i> <i>Customer requirements are developed by vehicle manufacturers for application in their supply chain by the nature of the product realization process. Therefore, where the vehicle manufacturers are being certified, the vehicle manufactures define how customer approvals and/or input are managed.</i>
2	4.4.1.2 Product safety	The organization shall have documented processes for the management of product-safety related products and manufacturing processes, which shall include but not be limited to the following, where applicable: a) – m) (...) NOTE: Special approval of safety related requirements or documents may be required by the customer or the organization's internal processes. is an additional approval by the function (typically the customer) that is responsible to approve such documents with safety-related content. <i>Rationale for change:</i>

NUMBER	IATF 16949 REFERENCE	SANCTIONED INTERPRETATION
2 (cont.)	4.4.1.2 Product safety	<i>Clarify any confusion related to special approval review for safety related requirements or documents.</i>
3 Revised	6.1.2.3 Contingency plans	The organization shall: a) – b) (...) c) prepare contingency plans for continuity of supply in the event of any of the following, but not limited to³: key equipment failures (also see Section 8.5.6.1.1); interruption from externally provided products, processes, and services; recurring natural disasters; fire; pandemics³; utility interruptions; cyber-attacks on information technology systems¹; labour shortages; or infrastructure disruptions; d) include, as a supplement to the contingency plans, a notification process to the customer and other interested parties for the extent and duration of any situation impacting customer operations; e) periodically test the contingency plans for effectiveness (e.g. simulations, as appropriate); for cybersecurity³: testing may include a simulation of a cyber-attack, regular monitoring for specific threats, identification of dependencies and prioritization of vulnerabilities. The testing is appropriate to the risk of associated customer disruption; Note: cybersecurity testing may be managed internally by the organization or subcontracted as appropriate² f) conduct contingency plan reviews (at a minimum annually) using a multidisciplinary team including top management, and update as required; g) document the contingency plans and retain documented information describing any revision(s), including the person(s) who authorized the change(s);. h) include in contingency plans the development and implementation of appropriate employee training and awareness.³

NUMBER	IATF 16949 REFERENCE	SANCTIONED INTERPRETATION
3 (cont.) Revised	6.1.2.3 Contingency plans	The contingency plans shall include provisions to validate that the manufactured product continues to meet customer specifications after the re-start of production following an emergency in which production was stopped and if the regular shutdown processes were not followed. <i>Rationale for change:</i> ¹<i>Organizations need to address the possibility of a cyber-attack that could disable the organization's manufacturing and logistics operations, including ransom-ware. Organizations need to ensure they are prepared in case of a cyber-attack.</i> ²<i>Moved from SI 17 and combined to make one SI for this IATF 16949 clause. Cybersecurity is a growing risk to manufacturing sustainability in all manufacturing facilities, including automotive. Contingency testing has also been identified by organizations and CBs as an area in need of clarification. This update provides details of what is to be tested as part of a cyber-attack contingency plan validation.</i> ³<i>Minor clarifications, including addition of pandemics in situations requiring contingency plans. Also, recognition that employee knowledge is a key step for an effective contingency plan.</i>

NUMBER	IATF 16949 REFERENCE	SANCTIONED INTERPRETATION
4 Revised	7.2.3 Internal auditor competency	The organization shall have a documented process(es) to verify that internal auditors are competent, taking into account any requirements defined by the organization and/or¹ customer-specific requirements. For additional guidance on auditor competencies, refer to ISO 19011. The organization shall maintain a list of qualified internal auditors. Quality management system auditors, manufacturing process auditors, and product auditors¹ shall all¹ be able to demonstrate the following minimum competencies: a) understanding of the automotive process approach for auditing, including risk-based thinking; b) understanding of applicable customer-specific requirements; c) understanding of applicable ISO 9001 and IATF 16949 requirements related to the scope of the audit; d) understanding of applicable core tool requirements related to the scope of the audit; e) understanding how to plan, conduct, report, and close out audit findings. Additionally, At a minimum,¹ manufacturing process auditors shall demonstrate technical understanding of the relevant manufacturing process(es) to be audited, including process risk analysis (such as PFMEA) and control plan. At a minimum,¹ product auditors shall demonstrate competence in understanding product requirements and use of relevant measuring and test equipment to verify product conformity. Where training is provided If the organization's personnel provide the training¹ to achieve competency, documented information shall be retained to demonstrate the trainer's competency with the above requirements. f) ... g)²

NUMBER	IATF 16949 REFERENCE	SANCTIONED INTERPRETATION
4 (cont.) Revised	7.2.3 Internal auditor competency	Rationale for change: ¹Distinguish competency requirements for quality management system auditors, manufacturing process auditors, and product auditors. Clarified the trainer competency expectations for internally provided training. ²Revised to show that requirements f) and g) were not excluded
5	7.5.1.1 Quality management system documentation	The quality manual shall include, at a minimum, the following: a) the scope of the quality management system, including details of and justification for any exclusions; b) documented processes established for the quality management system, or reference to them; c) the organization's processes and their sequence and interactions (inputs and outputs), including type and extent of control of any outsourced processes; d) a document (i.e., matrix for example, a table, a list, or a matrix) indicating where within the organization's quality management system their customer-specific requirements are addressed. Rationale for change: Some CBs and organizations wanted clarification that a matrix was not a mandatory document. A matrix is just one of multiple methods that are acceptable. The format used is up to the organization.

NUMBER	IATF 16949 REFERENCE	SANCTIONED INTERPRETATION
6	8.3.3.3 Special characteristics	The organization shall use a multidisciplinary approach to establish, document, and implement its process(es) to identify special characteristics, including those determined by the customer and the risk analysis performed by the organization, and shall include the following: a) documentation of all special characteristics in the product and/or manufacturing documents drawings (as required), relevant risk analysis (such as Process FMEA), control plans, and standard work/operator instructions; special characteristics are identified with specific markings and are cascaded through each of these documents; documented in the manufacturing documents which show the creation of, or the controls required, for these special characteristics; Rationale for change: <i>Clarifies the documentation of special characteristics in the product and/or manufacturing drawings.</i>
7	8.4.2.1 Type and extent of control - supplemental	The organization shall have a documented process to identify outsourced processes and to select the types and extent of controls used to verify conformity of externally provided products, processes, and services to internal (organizational) and external customer requirements. The process shall include the criteria and actions to escalate or reduce the types and extent of controls and development activities based on supplier performance and assessment of product, material, or service risks. Where characteristics or components “pass through” the organization’s quality management system without validation or controls, the organization shall ensure that the appropriate controls are in place at the point of manufacture. Rationale for change: <i>Clarify the organization’s responsibilities for pass through characteristics.</i>

NUMBER	IATF 16949 REFERENCE	SANCTIONED INTERPRETATION
8 Revised	8.4.2.3 Supplier quality management system development	The organization shall require their suppliers of automotive products and services to develop, implement, and improve a quality management system (QMS) with the ultimate objective of¹ eligible organizations² becoming certified to this Automotive QMS Standard. Using a risk-based model, the organization shall define a minimum acceptable level of QMS development and a target QMS development level for each supplier. certified to ISO 9001, unless otherwise Unless otherwise¹ authorized by the customer [e.g., item a) below], a QMS certified to ISO 9001 is the initial minimum acceptable level of development. Based on current performance and the potential risk to the customer, the objective is to move suppliers through the following QMS development progression: with the ultimate objective of becoming certified to this Automotive QMS Standard. Unless otherwise specified by the customer, the following sequence should be applied to achieve this requirement: a) compliance to ISO 9001 through second-party audits;¹ b) certification to ISO 9001 through third-party audits; unless otherwise specified by the customer, suppliers to the organization shall demonstrate conformity to ISO 9001 by maintaining a third-party certification issued by a certification body bearing the accreditation mark of a recognized IAF MLA (International Accreditation Forum Multilateral Recognition Arrangement) member and where the accreditation body's main scope includes management system certification to ISO/IEC 17021; c) certification to ISO 9001 with compliance to other customer-defined QMS requirements (such as Minimum Automotive Quality Management System Requirements for Sub-Tier Suppliers [MAQMSR] or equivalent) through second-party audits; d) certification to ISO 9001 with compliance to IATF 16949 through second-party audits;

NUMBER	IATF 16949 REFERENCE	SANCTIONED INTERPRETATION
8 (cont.) Revised	8.4.2.3 Supplier quality management system development	e) certification to IATF 16949 through third-party audits (valid third-party certification of the supplier to IATF 16949 by an IATF-recognized certification body). NOTE: The minimum acceptable level of QMS development may be compliance to ISO 9001 through second-party audits, if authorized by the customer. Rationale for change: ¹Clarified the expected supplier quality management system development progression. This approach supports the “Risk Based Thinking” concept emphasized throughout Section 8.4 of the standard. ²Additional clarification added in the first paragraph to address those organizations that are not eligible for IATF 16949 certification (examples including but not limited to the following: scrap metal suppliers, trucking companies who provide transport and logistics support, etc.).
9	8.7.1.1 Customer authorization for concession	The organization shall obtain a customer concession or deviation permit prior to further processing whenever the product or manufacturing process is different from that which is currently approved. The organization shall obtain customer authorization prior to further processing for “use as is” and rework for repair (see 8.7.1.5) dispositions of nonconforming product. If sub-components are reused in the manufacturing process, that sub-component reuse shall be clearly communicated to the customer in the concession or deviation permit. Rationale for change: Clarify requirements and eliminate contradiction in relation to customer approval associated with rework.

NUMBER	IATF 16949 REFERENCE	SANCTIONED INTERPRETATION
10 Revised	7.1.5.3.2. External laboratory	External/commercial/independent laboratory facilities used for inspection, test, or calibration services by the organization shall have a defined laboratory scope that includes the capability to perform the required inspection, test, or calibration, and either: — the laboratory shall be accredited to ISO/IEC 17025 or its national equivalent (e.g., CNAS-CL01 in China) by an accreditation body (Signatory) of the ILAC MRA (International Laboratory Accreditation Forum Mutual Recognition Arrangement – www.ilac.org)¹ or national equivalent² and include the relevant inspection, test, or calibration service in the scope of the accreditation (certificate); the certificate of calibration or test report shall include the mark of a national accreditation body; or — where an non-⁵accredited laboratory is not available utilized⁵ (e.g. for example, but not limited to: for⁵ specialist or integrated equipment, or for⁵ parameters with no international traceable standard reference,⁴ or original equipment manufacturers⁵), the organization is responsible to ensure that there is evidence that the laboratory has been evaluated and meets the requirements of Section 7.1.5.3.1 of IATF 16949.⁴ — there shall be evidence that the external laboratory is acceptable to the customer.⁴ NOTE: Such evidence may be demonstrated by customer assessment, for example, or by customer approved second party assessment that the laboratory meets the intent of ISO/IEC 17025 or national equivalent. The second party assessment may be performed by the organization assessing the laboratory using a customer approved method of assessment. Calibration services may be performed by the equipment manufacturer when a qualified laboratory is not available for a given piece of equipment. In such cases, the organization shall ensure that the requirements listed in Section 7.1.5.3.1 have been met. Use of calibration services, other than by qualified (or customer accepted) laboratories, may be subject to government regulatory confirmation, if required.^{3, 4}

NUMBER	IATF 16949 REFERENCE	SANCTIONED INTERPRETATION
10 (cont.) Revised	7.1.5.3.2. External laboratory	Note: integrated self-calibration of measurement equipment, including use of proprietary software, does not meet the requirements of calibration.⁴ Rationale for change: Some organizations found the lab accreditation requirements for external/commercial/independent laboratory facilities used for inspection, test, or calibration services confusing and needed clarification. Clarified lab accreditation requirements and expectations. ¹ Issued April 2018 ² Revised June 2018 ³ Reissued to show that the note and subsequent paragraphs were not excluded. ⁴ Clarified conditions under which a non-accredited laboratory may be used, where the original equipment manufacturer may be used, deleted the note, and acceptability of equipment self-calibration (April 2021). Also deleted the sentence about regulatory confirmation since that is not a government requirement. ⁵ Further clarifications provided explaining the conditions and assessment required if non-accredited laboratories are used; including for test and measurement original equipment manufacturers.

NUMBER	IATF 16949 REFERENCE	SANCTIONED INTERPRETATION
11	8.5.6.1.1 Temporary change of process controls	The organization shall identify, document, and maintain a list of the process controls, including inspection, measuring, test, and error-proofing devices., that includes the primary process control and the approved back-up or alternate methods. The list of process controls shall include the primary process controls and the approved back-up or alternate methods, if back-up or alternate methods exist. Rationale for change: <i>Clarified that not every primary process control has a back-up or alternate method. Clarified that if a back-up or alternate method exists, that those back-up or alternate methods are included on a list maintained by the organization. It is not a requirement to have an alternative process control for every primary control.</i>
12	5.1.1.2 Process effectiveness and efficiency	Top management shall review the product realization processes effectiveness and efficiency of the quality management system and support processes to evaluate and improve their effectiveness and efficiency the organization's quality management system. The results of the process review activities shall be included as input to the management review (see Section 9.3.2.1.). Rationale for change: <i>Clarified that not every process requires an efficiency measure. The organization needs to determine which processes require efficiency measures within their quality management system. Additionally, the organization's problem-solving processes need to have an effectiveness review conducted by the organization's management.</i>

NUMBER	IATF 16949 REFERENCE	SANCTIONED INTERPRETATION
13	9.3.2.1 Management review inputs – supplemental	Input to management review shall include: a) cost of poor quality (cost of internal and external nonconformance); b) measures of process effectiveness; c) measures of process efficiency for product realization processes, as applicable; d) product conformance; e) assessments of manufacturing feasibility made for changes to existing operations and for new facilities or new product (see Section 7.1.3.1); f) customer satisfaction (see ISO 9001, Section 9.1.2); g) review of performance against maintenance objectives; h) warranty performance (where applicable); i) review of customer scorecards (where applicable); j) identification of potential field failures identified through risk analysis (such as FMEA); k) actual field failures and their impact on safety or the environment. Rationale for change: <i>Clarified that not every process requires an efficiency measure. The organization needs to determine which processes require efficiency measures within their quality management system.</i>

NUMBER	IATF 16949 REFERENCE	SANCTIONED INTERPRETATION
14	9.2.2.2 Quality management system audit	The organization shall audit all quality management system processes over each a three-year audit cycle calendar period, according to an annual programme, using the process approach to verify compliance with this Automotive QMS Standard. Integrated with these audits, the organization shall sample customer-specific quality management system requirements for effective implementation. The complete audit cycle remains three years in length. The quality management system audit frequency for individual processes, audited within the three-year audit cycle, shall be based upon internal and external performance and risk. Organizations shall maintain justification for the assigned audit frequency of their processes. All processes are required to be sampled throughout the three-year audit cycle and audited to all applicable requirements in the IATF 16949 standard, including ISO 9001 base requirements, and any customer-specific requirements. <i>Rationale for change:</i> <i>Clarified that the audit cycle remains three years in length. Deleted IATF 16949 FAQ 18 and put former FAQ 18 2nd paragraph requirements into SI 14. Clarified that all processes are to be audited during the three-year audit cycle.</i>

NUMBER	IATF 16949 REFERENCE	SANCTIONED INTERPRETATION
15	3.1 Terms and definitions for the automotive industry	embedded software Embedded software is a specialized programme stored in an automotive component (typically computer chip or other non-volatile memory storage) specified by the customer, or as part of the system design, to control its function(s). To be relevant in the scope of IATF 16949 certification, the part that is controlled by embedded software must be developed for an automotive application (i.e., passenger cars, light commercial vehicles, heavy trucks, buses, and motorcycles; see Rules for achieving and maintaining IATF Recognition, 5th Edition, Section 1.0 Eligibility for Certification to IATF 16949, for what is eligible for “Automotive”). NOTE: Software to control any aspect of the manufacturing process (e.g., machine to manufacture a component or material) is not included in the definition of embedded software. Rationale for change: Minimize confusion regarding embedded software and what is applicable. Deleted IATF 16949 FAQ 10.

NUMBER	IATF 16949 REFERENCE	SANCTIONED INTERPRETATION
16	9.3.2.1 Management review inputs – supplemental	Input to management review shall include: a) cost of poor quality (cost of internal and external nonconformance); b) measures of process effectiveness; c) measures of process efficiency for product realization processes, as applicable; d) product conformance; e) assessments of manufacturing feasibility made for changes to existing operations and for new facilities or new product (see Section 7.1.3.1); f) customer satisfaction (see ISO 9001, Section 9.1.2); g) review of performance against maintenance objectives; h) warranty performance (where applicable); i) review of customer scorecards (where applicable); j) identification of potential field failures identified through risk analysis (such as FMEA); k) actual field failures and their impact on safety or the environment; l) summary results of measurements at specified stages during the design and development of products and processes, as applicable. Rationale for change: <i>In the section “8.3.4.1 Monitoring” the summary results of measurements at specified stages during the design and development of products and processes was required as an input to management review; however, it was not displayed in the section 9.3.2.1. Measurements may consider, for example: timing, costs, or feasibility.</i>

NUMBER	IATF 16949 REFERENCE	SANCTIONED INTERPRETATION
17	6.1.2.3 Contingency plans	a) — d) (...) e) periodically test the contingency plans for effectiveness (e.g. simulations, as appropriate); cybersecurity testing may include a simulation of a cyber attack, regular monitoring for specific threats, identification of dependencies and prioritization of vulnerabilities. The testing is appropriate to the risk of associated customer disruption; Note: cybersecurity testing may be managed internally by the organization or subcontracted as appropriate Rationale for change: <i>Combined with SI 3, since that is for the same IATF 16949 clause</i>
18	7.1.3.1 Plant, facility, and equipment planning	The organization shall use a multidisciplinary approach including risk identification and risk mitigation methods for developing and improving plant, facility, and equipment plans. In designing plant layouts, the organization shall: a) optimize material flow, material handling, and value-added use of floor space including control of nonconforming product; and b) facilitate synchronous material flow, as applicable; and c) implement cyber protection of equipment and systems supporting manufacturing. Rationale for change: <i>Cybersecurity is not limited to the support functions and office areas using computers. Manufacturing also uses computerized controls and equipment which would be at risk to</i>

NUMBER	IATF 16949 REFERENCE	SANCTIONED INTERPRETATION
18 (Cont.)	7.1.3.1 Plant, facility, and equipment planning	<i>cyber-attack. This addition drives the implementation of necessary protections to ensure continued operation and production to meet customer requirements.</i>
19	8.4.2.4 Supplier monitoring	The organization shall have a documented process and criteria to evaluate supplier performance in order to ensure conformity of externally provided products, processes, and services to internal and external customer requirements. At a minimum, the following supplier performance indicators shall be monitored: a) delivered product conformity to requirements; b) customer disruptions at the receiving plant, including yard holds and stop ships; c) delivery schedule performance; d) number of occurrences of premium freight. If provided by the customer, ... in their supplier performance monitoring: e) ... f) Rationale for change: <i>Premium freight is already included as part of the Customer Satisfaction requirement defined in 9.1.2.1. Measuring occurrences of premium freight from suppliers is also outside the scope of the organisation's quality management system as this is an internal supplier performance metric.</i>

NUMBER	IATF 16949 REFERENCE	SANCTIONED INTERPRETATION
20	10.2.3 Problem Solving	The organization shall have a documented process(es) for problem solving, which prevent(s) recurrence, including: a) defined approaches for various types and scale of problems (e.g., new product development, current manufacturing issues, field failures, audit findings); b) containment, interim actions, and related activities necessary for control of nonconforming outputs (see ISO 9001, Section 8.7); c) root cause analysis, methodology used, analysis, and results; d) implementation of systemic corrective actions, including consideration of the impact on similar processes and products; e) verification of the effectiveness of implemented corrective actions; f) reviewing and, where necessary, updating the appropriate documented information (e.g., PFMEA, control plan). Where the customer has specific prescribed processes, tools, or systems for problem solving, the organization shall use those processes, tools, or systems unless otherwise approved by the customer. Rationale for change: <i>Corrective actions are often observed to miss the important step of prevention of recurrence. Prevention of recurrence has now been added as a requirement.</i>

NUMBER	IATF 16949 REFERENCE	SANCTIONED INTERPRETATION
21	6.1.2.1 Risk Analysis	The organization shall include in its risk analysis, at a minimum; a) lessons learned from product recalls, product audits, field returns and repairs, complaints, scrap, and rework, b) cyber-attack threats to information technology systems. The organization shall retain documented information as evidence of the results of risk analysis. Rationale for change: <i>Potential cyber-attacks pose a risk to all certified organizations due to the valuable information held within their information technology systems. Organizations need to consider potential cyber-attacks in their risk analysis.</i>
22	7.2.1 Competence – supplemental	The organization shall establish and maintain a documented process(es) for identifying training needs including awareness (see Section 7.3.1) and achieving competence of all personnel performing activities affecting conformity to product and process requirements. Personnel performing specific assigned tasks shall be qualified, as required, with particular attention to the satisfaction of customer requirements. To reduce or eliminate risks to the organization, the training and awareness shall also include information about prevention relevant for the organization's working

NUMBER	IATF 16949 REFERENCE	SANCTIONED INTERPRETATION
22 (cont.)	7.2.1 Competence - supplemental	environments and employees' responsibilities, such as recognizing the symptoms of pending equipment failure and/or attempted cyber-attacks. <i>Rationale for change:</i> Employee knowledge is a key enabler to prevent issues from becoming significant, including identifying potential equipment failure and cyber-attacks.
23 Revised	4.4.1.1 Conformance of products and processes	The organization shall ensure conformance of all products and processes, including replacement service² parts and those that are outsourced, to all applicable customer, statutory, and regulatory requirements, including conformance to material requirements¹ (see Section 8.4.2.2). <i>Rationale for change:</i> ¹While not a new requirement, material regulatory compliance is becoming an increasingly important area in the automotive sector. ²To align with the Rules 6th Edition language.
24	Annex A: A.1 Phases of the Control Plan (Notes)	All other sections of Annex A: A.1 are unchanged NOTE 1 It is recommended that the organization require its suppliers to meet the requirements of this Annex. NOTE 2 For bulk materials, the control plans do not list most of the production information. This information can be found in the corresponding batch formulation/recipe details. NOTE 3 For highly automated processes (e.g., semiconductors, machining, welding) where the control method (i.e., specification/tolerances, sample size, frequency) is

NUMBER	IATF 16949 REFERENCE	SANCTIONED INTERPRETATION
24 (cont.)	Annex A: A.1 Phases of the Control Plan (Notes)	controlled by a system (e.g., MES - Manufacturing Execution System or similar), summary control information is acceptable with direct references or linkage to the system that manages the detailed process control information. <i>Rationale for change:</i> <i>Documenting all controls of highly automated and complex processes (such as semiconductor fabrication, some machining or welding) could result in control plans which are too huge, if printed, to be useful for their intended purpose.</i> <i>Allowing reference and/or linkage to the system controlling the process removes potential for outdated information and errors and mirrors the actual processes used.</i>
25	Annex A: A.2 Elements of the Control Plan	A.2 Elements of the Control Plan A control plan includes, at a minimum, the following contents: General data a) control plan number; b) issue date and revision date, if any; c) customer information (see customer requirements); d) organizations name/site designation e) part number(s) or common control plan designation f) part name/description; g) engineering change level; h) phase covered (prototype, pre-launch, production); i) key contact

NUMBER	IATF 16949 REFERENCE	SANCTIONED INTERPRETATION
25 (cont.)	Annex A: A.2 Elements of the Control Plan	j) part/process step number; k) process name/operation description; l) functional group/area responsible. All other sections of Annex A: A2 (Product control, Process control, Methods and Reaction plan) are unchanged. Rationale for change: <i>Common control plans used for multiple parts can result in a list of covered part numbers that is too large to include in the Control Plan document. Use of a common control plan designation instead would simplify such a reference.</i>

27	Foreword – Automotive QMS Standard	This Automotive Quality Management System Standard, herein referred to as “Automotive QMS Standard” or “IATF 16949,” along with applicable automotive customer-specific requirements, ISO 9001:2015 requirements, and ISO 9000:2015 defines the fundamental quality management system requirements for automotive production and relevant service replacement part organizations. As such, this Automotive QMS Standard cannot be considered a stand-alone QMS Standard but has to be comprehended as a supplement to and used in conjunction with ISO 9001:2015. ISO 9001:2015 is published as a separate ISO Standard.

NUMBER	IATF 16949 REFERENCE	SANCTIONED INTERPRETATION
27 (cont.)	Foreword – Automotive QMS Standard	IATF 16949:2016 (1st edition) represents an innovative document, given the strong orientation to the customer, with inclusion of a number of consolidated previous customer specific requirements. Annex B is provided for guidance to implement the IATF 16949 requirements unless otherwise specified by customer specific requirements. Rationale for change: <i>To align with the Rules 6th Edition language.</i>
28	1.1 Scope - automotive supplemental to ISO 9001:2015	This Automotive QMS Standard defines the quality management system requirements for organizations that manufacture and, where applicable, design and development automotive products (see Section 3.1) for automotive customers. production and, when relevant, assembly, installation, and services of automotive-related products, including products with embedded software. This Automotive QMS Standard is applicable to sites of the organization where manufacturing of automotive products occur. customer-specified production parts, service parts, and/or accessory parts occur. This Automotive QMS Standard should be applied throughout the automotive supply chain. Rationale for change: <i>To align with the Rules 6th Edition language.</i>

NUMBER	IATF 16949 REFERENCE	SANCTIONED INTERPRETATION
29	3.1 Terms and definitions for the automotive industry	accessory part customer-specified additional component(s) that are either mechanically or electronically connected to the vehicle or powertrain before (or after) delivery to the final customer (e.g., custom floor mats, truck bed liners, wheel covers, sound system enhancements, sunroofs, spoilers, super-chargers, etc.) aftermarket part replacement part(s) not procured or released by an OEM for service part applications, which may or may not be produced to original equipment specifications automotive customer Any organization in the automotive supply chain purchasing automotive products. automotive products a) Parts (including those with embedded software) and processed materials which are manufactured to an automotive customer's specifications and integrated into the automotive vehicle during its manufacture (also known as "Production Parts" or "Production Materials"). Note: "Integrated" also pertains to parts and materials that are filled into, attached to, connected to, or placed in or on the vehicle. b) Parts manufactured to OEM specifications that are procured or released by the OEM and integrated into the automotive vehicle after its manufacture and before

29 (cont.)	3.1 Terms and definitions for the automotive industry	or after delivery to the final customer (also known as “Accessory Parts”). c) Replacement parts and materials for automotive vehicles, including remanufactured parts. manufacturing process of making or fabricating – production materials; – production parts or service replacement parts; – assemblies; or – heat treating, welding, painting, plating, or other finishing services replacement parts and materials Parts and materials, including service, aftermarket and remanufactured parts and materials, used for repair and maintenance services on automotive vehicles. service part replacement part(s) manufactured to OEM specifications that are procured or released by the OEM for service part applications, including remanufactured parts Rationale for change: <i>To align with the Rules 6th Edition language.</i>

NUMBER	IATF 16949 REFERENCE	SANCTIONED INTERPRETATION
30	8.3.5.1 Design and development outputs — supplemental	The product design output shall be expressed in terms that can be verified and validated against product design input requirements. The product design output shall include but is not limited to the following, as applicable a) design risk analysis (FMEA); b) reliability study results; c) product special characteristics; d) results of product design error-proofing, such as DFSS, DFMA, and FTA; e) product definition including 3D models, technical data packages, product manufacturing information, and geometric dimensioning & tolerancing (GD&T); f) 2D drawings, product manufacturing information, and geometric dimensioning & tolerancing (GD&T); g) product design review results; h) service diagnostic guidelines and repair and serviceability instructions; i) replacement service part requirements; j) packaging and labeling requirements for shipping. NOTE Interim design outputs should include any engineering problems being resolved through a trade-off process. <i>Rationale for change:</i> <i>To align with the Rules 6th Edition language.</i>
